

THE PANDORA PAPERS

STUDY GUIDE

INGENIUM

INTRODUCTION

A major corporation stands accused of causing serious, documented environmental harm. The case has reached the courtroom.

Delegates will take on the roles of **Prosecution and Defence**, using real evidence, environmental science, and policy reasoning to establish what happened, assess who is responsible, determine the scale and significance of the damage, and defend an appropriate response.

Cases are drawn from **real, publicly documented corporate environmental incidents**, including oil spills, deforestation and land-clearing fires, industrial contamination, and mining disasters. The category goes beyond identifying environmental harm: delegates must connect **cause to consequence, evidence to claim, and responsibility to remedy**. They must distinguish established facts from assumptions, evaluate competing arguments fairly, and defend practical solutions under pressure.

ROUND 1- FULL COURTROOM (IN ROLE)

Teams receive a case file containing the shared background, their **Prosecution or Defence brief**, and an evidence timeline. After preparation, each side delivers an **opening statement** outlining what happened, who it holds responsible, and what it intends to prove.

Teams then face **cross-examination** by the opposing side. Throughout the round, the judge may introduce a **Judge's Challenge**, a new piece of context, a pointed question, or a difficult hypothetical, which both sides must address on the spot.

Judged on: evidence accuracy, clarity and structure, strength of argument and rebuttal, environmental reasoning, and the ability to adapt under pressure while maintaining a coherent case.

Delegates per team: 3

ROUND 2 - ENVIRONMENTAL MANAGEMENT INTENSIVE (ROLES RESET)

Roles from Round 1 do not carry over. All teams receive a new real-world environmental crisis and must respond through a **crisis simulation**, where evolving updates may change the situation and force teams to revise their strategy.

Teams then present and defend their response, explaining its **scientific basis, feasibility, environmental impact, and resource requirements**. Judges will assess the strength, practicality, innovation, and adaptability of each proposal before allocating funding.

Teams must not only manage the crisis effectively, but also **convince the judges that their solution deserves the resources required to implement it**.

Delegates per team: 3

TOPICS TO PREPARE FROM

Delegates should have a working understanding of:

- Ecology & ecosystems
- Climate change & greenhouse gases
- Pollution & waste management
- Biodiversity & habitat loss
- Deforestation & land degradation
- Water resources & pollution
- Industrial activity & resource extraction
- Environmental impact assessment
- Corporate environmental responsibility
- Environmental law, regulation & enforcement
- Sustainable development & SDGs
- Environmental justice & affected communities
- Environmental remediation & restoration
- Major corporate environmental cases
- Reading environmental graphs, maps, tables & scientific evidence
